

Ray

Hi Dixie!

I'm sorry you didn't get time to drop back to the Genetics Building to pick up cultures. Whenever you're ready, let me know again what you can use in the *Sal* mohella variants. Under separate cover I'm sending some reprints on this subject; my dossiers lack a card with your name-- if you could let me know which, if any of our reprints you already have, I'll make up any deficits.

P. Grabar visited here, and in a brief conversation had a suggestion on the flagellar immunocalimentation-- i.e., that a proteinase would have the appropriate broad specificity. At neutral pH some of these enzymes will form complexes with their substrates without quickly splitting them. Sounds provocative.

Yours

Joshua Lederberg
